Sealol® Welded Metal Bellows

Type 604HTC

Type 609HTC

### Product Description

The Type HTC\* high-temperature corrosion resistant welded metal bellows seal is a unique advanced technology for reliably sealing fluids in harsh high-temperature corrosive environments. The Type HTC also provides superior face stability at elevated temperatures.

This all-Inconel® seal eliminates the need for plating and is ideally suited for applications that contain organic acids, broadly referred to as naphthenic acid, and sulfur compounds that attack most other alloys at high-temperature.

Specially designed pressure-compensating seal faces and a thermally compliant primary ring adapter provide exceptional seal face stability that adapts to a wide range of temperature excursions inherent in high-temperature applications.

Even if the application is not corrosive, the extra face stability provided by the seal can extend your MTBR in many other non-corrosive services.

The API 682/ISO 21049 qualified HTC seals are available in both stationary and rotating configurations, and single and dual seal arrangements.

Type 604HTC - high-temperature corrosion resistant stationary bellows assembly capable of handling high shaft speed applications and high shaft-to-seal chamber misalignment.

Type 609HTC - high-temperature bellows assembly intended for those demanding applications where a dependable, high-strength, rotating seal is preferred.

### Performance Capabilities

- Temperature: -75°C to 425°C/-100°F to 800°F  
(with flexible graphite static packing)
- Pressure: dynamic - vacuum to 20 barg/300psig  
static - 31 barg/450 psig (see basic pressure ratings)
- Speed: Type 604HTC - up to 50 mps / 10,000 fpm  
Type 609HTC - up to 25 mps / 5000 fpm

### Design Features

- All-inconel metallurgy – meets NACE MR0175/MR0103
- ID and OD pressure capability – withstands reverse pressurization
- Thermally compliant primary ring adapter
- Pressure compensating primary ring
- Edge-welded metal bellows
- Advanced silicon carbide composite
- API 682/ISO 21049 qualification tested
- Available in single or dual cartridge arrangements
- Narrow radial cross-section fits most popular pump models without modification
- HTC is used as a component in many cartridge arrangements and configurations

# Type 604HTC/609HTC

## HIGH-TEMPERATURE CORROSION RESISTANT SEALS

Technical Specification

### Typical Type 604HTC Single Arrangement (API 682/ISO 21049 Type 1604HTC)

A single stationary Type 604HTC seal that contains a steam guide (steam deflector or anti-coking baffle) which directs steam to the area where coke would tend to form and routes the steam to carry material away from the seal and seal faces.

### Typical Type 609HTC/ECS Arrangement

A dual high-temperature emission containment seal (ECS) with inner rotating, 609HTC seal. The ECS, along with a steam quench, provides an additional level of safety/back-up in high-temperature applications.

### Typical Type 604HTC/ECS Arrangement

A dual high-temperature emission containment seal (ECS) with inner stationary, 604HTC seal. The ECS, along with a steam quench, provides an additional level of safety/back-up in high-temperature applications.

### Typical Type 2609HTC/3609HTC Tandem Arrangement

A dual seal in which one mating ring is mounted between the two flexible elements (bellows) and one flexible element is mounted between the two mating seal rings. Arrangement has a Type 609HTC inner seal with standard Type 609 or 609HTC outer seal.

### Typical Type 604HTC Dual Face-To-Face Arrangement

A dual seal in which both of the mating seal rings are mounted between the flexible elements (bellows). Arrangement has a Type 604HTC inner seal with standard Type 604 or 604HTC outer seal.

# Type 604HTC/609HTC

## HIGH-TEMPERATURE CORROSION RESISTANT SEALS

Technical Specification

### Basic Pressure Rating

#### Type 604HTC/609HTC OD Pressure Rating

Notes:

1. Basic pressure rating curve based on single-ply bellows.
2. Basic pressure rating curve is differential pressure applied to seal outside diameter.

The basic pressure rating is for a standard seal, as shown in the typical arrangement, when installed according to the criteria given in this data sheet and generally accepted industrial practices.

The basic pressure rating assumes stable operation at 3600 rpm in a clean, lubricating, non-volatile liquid with an adequate flush rate. When used with the multiplier factors, the basic pressure rating can be adjusted to provide a conservative estimate of the dynamic pressure rating.

Contact John Crane for process services outside this range or a more specific assessment of the dynamic pressure rating.

#### Type 604HTC/609HTC ID Pressure Rating

Notes:

1. Basic pressure rating curve based on single-ply bellows.
2. For applications above 600°F(315°C) and 200psig(13.8 barg), consult John Crane.

### Multiplier Factors

	Selection Consideration	Multiplier Factor
		Sealide-C/TC vs. SiC
<b>Speed</b>	Up to 3600 rpm Above 3600 rpm	x 1.00 x (3600/speed)
<b>Sealed Fluid Lubricity</b>	Petroleum/Gasoline, Kerosene, Lube Oil, etc. Water and Aqueous Solutions (< 80°C/176°F) Light Hydrocarbons (see Note 1)	x 1.00 x 0.75 (see Note 2)
<b>Sealed Fluid Temperature</b> (see Note 3)	Up to 425°C/800°F	x 1.00

Notes:

1. Specific gravity  $\geq 0.6$  and ratio of sealed pressure to vapor pressure  $> 1.5$ .
2. More details regarding the fluid and the operating conditions are required.
3. Temperature at the seal faces includes effects of flush, quench, and cooling. Temperatures must not exceed limits shown in max. temperature limits section.

#### Example for determining OD pressure rating limits:

Seal: Type 604HTC  
Size: 3.00"/76mm  
Product: high viscosity gas oil  
Face material: sealide-C vs. silicon carbide  
Operating temperature: 325°C/620°F  
Operating speed: 3600 rpm

#### Example for determining OD dynamic pressure rating:

The maximum pressure for a particular application is the lesser of the maximum pressure limit curve or the pressure calculated when the multiplier factors are applied to the specific seal face material curve.

Maximum pressure limit curve:  
20 barg/290 psig max. pressure

Hard faces limit curve: 32 barg/460 psig

Calculated limit: 32 barg/460 psig x 1.00 x 1.00 x 1.00 = 32 barg/460 psig

At 3600 rpm with the service conditions noted, a 3.00"/76mm (seal size) Type 604HTC has a maximum operating pressure limit of 20 barg/290 psig.

### Multiplier Factors (continued)

#### Example for determining ID pressure rating limits:

Seal: Type 609HTC

Size: 2.00"/50mm

Product: residuum

Face material: Sealide-C vs. silicon carbide

Operating temperature: 315°C/600°F

Operating speed: 3600 rpm

#### Example for determining ID dynamic pressure rating:

The maximum ID pressure for a particular application is the lesser of the maximum pressure limit curve or the pressure calculated when the multiplier factors are applied to the specific seal face material curve.

Maximum pressure limit curve: 16.5 barg/240 psig max. ID pressure

Hard faces limit curve: 20 barg/300 psig

Calculated limit: 20 barg/300 psig x 1.00 x 1.00 x 1.00 = 20 barg/300 psig

At 3600 rpm with the service conditions noted, an 2.0"/50mm (Seal Size) Type 609HTC has a maximum operating pressure limit of 16.5 barg/240 psig max ID pressure.

### Materials of Construction

SEAL COMPONENTS	MATERIALS	
Description	Standard	Options
Bellows	Alloy 718 (UNS N07718)	—
Primary Ring	Sealide-C (Sintered)	Tungsten Carbide*
Static Seals	Flexible Graphite	—
Primary Ring Adapter	Alloy 718 (UNS N07718)	—
Adapter	Alloy 718 (UNS N07718)	—

\*Tungsten Carbide recommended for process temperatures less than -40°C/-40°F.

### Welded Metal Bellows

#### Bellows design features:

- Optimum 45° tilt angle
- Three-sweep radius
- Nesting ripple plate design
- Static secondary seal
- Light spring loads

#### Bellows benefits:

- Uniform plate rigidity and stress distribution
- Enhanced fatigue strength
- Pressure-balanced by design
- Less heat generated
- Lower power consumption

### Sealide-C Advanced Silicon Carbide Composite Primary Ring

Sealide-C is a state-of-the-art sintered silicon carbide with low friction and the inherent lubricity of free graphite. This silicon carbide is a tough, hard, heat resistant, long wearing, inert seal face material. When compared with other face materials, Sealide-C provides improved corrosion resistance, improved thermal shock resistance, and lower running face temperatures.

### Technology

The HTC seal provides an effective solution in sealing corrosive fluids at elevated temperatures by utilizing a complete all-Inconel metallurgy and unique face seal technology that provides exceptional stability across a wide range of pressure/temperature conditions.

An effective means of ensuring seal reliability is by controlling seal face distortion, which directly affects the operating conditions at the sealing surface. Pressure compensating seal faces and thermally compliant components ensure exceptional seal face flatness stability that resists any compromising effects from temperature and pressure. Such exceptional face stability can result in reduced leakage and longer seal life.

In dual seal arrangements, the HTC is capable of handling reverse pressurization. In a dual unpressurized bellows arrangement, the primary seal is designed to contain a buffer reverse pressure. In a pressurized dual seal arrangement the primary seal normally operates with reverse barrier pressure and is designed to contain the process fluid in the event of loss of barrier pressure.

The HTC has proven to be a superior design for high temperature corrosive applications up to 800°F/425°C.

### Typical Applications

- Hydrocarbons
- Aromatic fractionation products (benzene, toluene, solvents, etc.)
- Crude oil fractionation products (fuel oil, lubricating oil, gasoline, etc.)
- Chemicals, caustics, some acids, aqueous solutions, lubricating liquids
- Heat transfer fluids
- Cryogenic

Inconel is a registered to Inco Alloys International Inc.
